

JUNK-Fi SAMPLER JF-1

The Audible Disease Junk-Fi Sampler is a low 8-bit sampler that can record up to 20 seconds of sound and then play it back. The knob sucks power to the sampling circuit giving you the ability to get some ultra-gritty output. The static memory of the sampler will hold the sample even if the power is turned off.

Plug audio signal into input – plug amplification or other effects processing into output – turn power switch ON – press and hold the RECORD button to record a sample (up to 20 seconds) – press the PLAY button to playback – you can adjust the CHOKE knob to distort output and input signal even further – most interesting when CHOKE is turned down a bit and a sample is recorded then played back when CHOKE is up. If you need to change the battery, remove the 4 screws on the bottom – make sure it's the right sized screwdriver!! – Then put in a new 9-volt battery, please.
