

SYNTH BOMB SB-1

The Audible Disease Synth Bomb SB-1 is a simple yet fun to use hand-held monophonic synthesizer that produces an almost boundless array of sounds! Just plug it in and you're ready to start making some severe noise. The SB-1 incorporates four square-wave oscillators running in parallel. The frequency of each oscillator can be controlled by how much light is hitting each of the four photo-eyes... the more light that hits the photo-eye the higher the frequency of that oscillator. Cover the photo-eyes with your fingers for a virtually endless palate of sound! Oh, did we mention that this thing is loud? Well, it is!

Operates with a 9-volt battery only. Plug a 1/4 inch cable into the jack to turn on the unit.

If the sound and/or the LED become weak, remove the four screws on the bottom of the unit with a screwdriver of the correct size and replace the battery. Use the foam padding to keep the battery from flopping around inside and replace the bottom plate. Unplug the cable from the jack when not in use to preserve battery life. Remove the battery if you plan to not use the SB-1 for an extended length of time.
